

Physical Security Risk Assessment

Ensure the integrity of your
physical assets worldwide

Corporate risk leaders and security teams need a comprehensive understanding of their operational risk landscape, including geographical locations, asset types, and security contexts.

Physical Security Risk Assessment combines Control Risks' 50 years of expertise in security and site assessment with dedicated and bespoke analysis to identify threats and vulnerabilities across your entire asset portfolio.

Our data-led approach is tailored to your security profile, asset types, and the KPIs and data sources you specify, so it is relevant to your organisation's needs. These data point inputs are backed by our experience and understanding in reviewing organisational security at some of the largest and most targeted organisations across the globe. We deliver data-driven, risk-based analysis to your decision-makers to safeguard your people, data, and assets – wherever they are located.

We offer an integrated suite of services, designed to ensure proportionate mitigations are identified, prioritised and consistently applied. This includes services from light-touch self-service evaluation to fully integrated, expert-led Security Threat and Risk Assessments with Active Monitoring.

Our analysis and reporting provide:

- ▶ Insight into overall risk profiles, security risks, trends and compliance metrics
- ▶ A customised risk profile focusing on the frequency of incidents, location, asset types, vulnerability and potential impact
- ▶ Ongoing monitoring of your situational context
- ▶ Data that supports a strategic, risk- and evidence-led investment and remediation plan spanning your asset portfolio

Our Methodology and approach

PSRA is based on our security assessment methodology and approach. We have applied and refined this approach through thousands of security assessments for various organisations worldwide. Our approach leverages multiple sources of data points from results of physical site assessments, incident trends, political sources and on-the-ground intelligence. This analysis identifies trends and systemic issues to benchmark performance across all premises, all presented visually with customisation through search and filter options.

Our assessment framework

The Physical Security Risk Assessment model helps organisations determine and assess security risks across domains by presenting outputs in role-specific dashboards for enhanced visibility. From high-level dashboards offering strategic insights into security risk, overall risk profiles, trends, and compliance metrics, users can drill down for a more operational perspective with detailed KPIs for operational teams providing actionable insights into specific or recurring vulnerabilities, and targeted recommendations for immediate remediation.

Stakeholders can also use customisable filters by location, asset type, or risk category for more focused analysis.

Providing cross-portfolio insights, trends and unified analysis, we consolidate security data across all premises to identify systemic issues and benchmark performance.

Physical Security Risk Assessment

Ensure the integrity of your physical assets worldwide

Control Risks

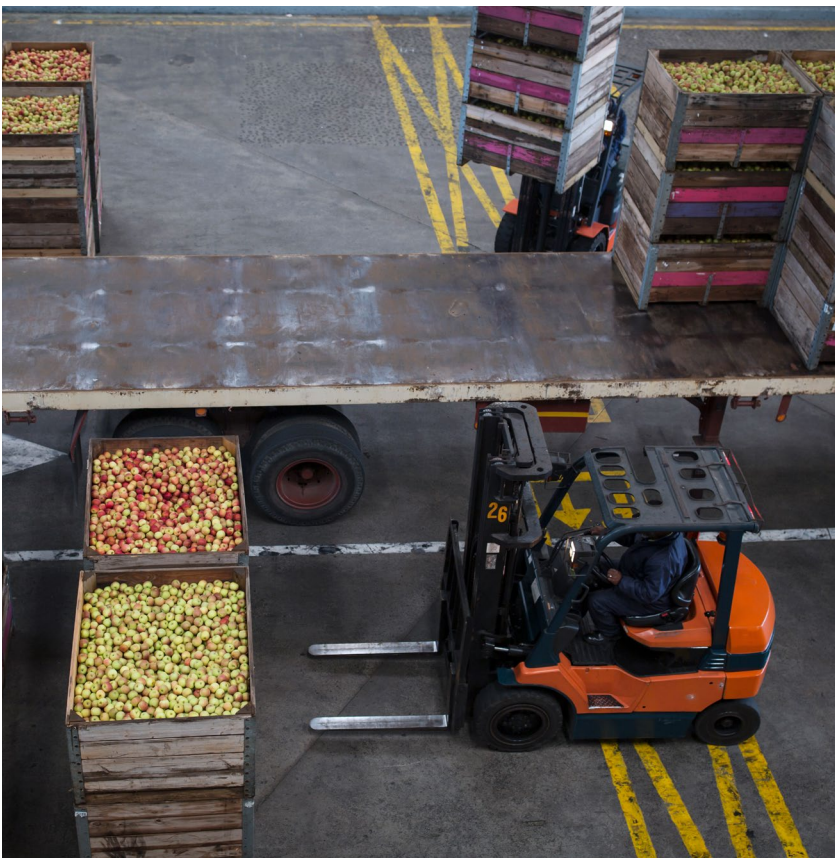

The PSRA model can include additional elements, such as bespoke threat and risk monitoring and response actions. These can include the impact of new or proposed security controls to limit residual risk, active monitoring, and prioritised mitigations for events that may negatively impact an asset's risk profile.

Whether your organisation operates in a limited number of physical sites or has locations worldwide with varying asset types (residential, office space, retail sites, manufacturing, distribution, extraction, etc.), you will have precise, prioritised actionable controls that enable your internal stakeholders to make informed, data-driven decisions that strengthen asset security.

Control Risks ONE

Control Risks can advise on further mitigations, such as ongoing monitoring and operational security support via Control Risks ONE, our global risk and security centre. Adaptive and scalable, ONE instantly bolsters your existing operational capabilities and provides you with 24/7 access to Control Risks' best-in-class risk and security expertise.

Case study: global manufacturing

A global food and ingredients manufacturer wanted to take a data-driven, risk-led approach to assessing and managing security vulnerabilities across their global portfolio. This included gathering and consolidating data across 50 locations, including manufacturing plants, R&D centres, and office facilities.

Control Risks conducted workshops and consultations to create a customised assessment model with tailored questions and weighted criteria. We designed and implemented a bespoke data collection platform to simplify and standardise data input during site reviews and delivered an interactive dashboard for use by several internal stakeholders.

Through our customised dashboards, the manufacturer could assess and monitor multiple locations through the customised dashboards and visualise threats and vulnerabilities. This enhanced their decision-making, resource allocation and overall threat mitigation strategies without requiring extensive global travel.

About Control Risks

For over fifty years, Control Risks has ensured that our clients are secure, compliant and resilient wherever they do business. We have delivered thousands of Physical Security Risk Assessments and have unrivalled expertise in helping organisations understand and contextualise their risks to seize opportunities and grow.
